

Succulents are plants with fleshy thick leaves and stems that store water. Succulents are able to survive on limited amounts of water like dew and mist. They are drought tolerant.

How to Grow Succulents Indoors

- *Choose an appropriate succulent for indoors. Typically green varieties of succulents adapt to indoor conditions.**
- *Provide a well-draining potting medium. Use a cactus mix and mix some perlite in it.**
- *Choose your container. The container should have a large drainage hole. Avoid using glass. Fill the bottom third of the container with the potting mix. Position your succulents and back fill.**
- *Place the potted succulent in full sun. Ideally a window facing south. Succulents need a minimum of six hours of sun a day.**
- *Allow the potting mix to dry out between waterings. Do not over water. Saturate the potting mix when you do water but allow it to dry out before watering again. Overwatering is biggest mistake.**
- *Fertilize once a year. Use a water soluble fertilizer (8-8-8 or 10-10-10) The ideal time to fertilize is the spring as the days get longer. Do not fertilize in the winter.**
- ***Notes- It is natural for bottom leave to be expelled from the succulent. If your succulent gets spindly or appears to be stretching it is not getting sufficient sun.**

Suggested Succulents for indoors
