NORTH TO STATE TO THE TOTAL TOTA

Red River and Devils Lake Basin - 2020 Spring Flood Outlook

Discussion Points 2/13/2020 prepared by

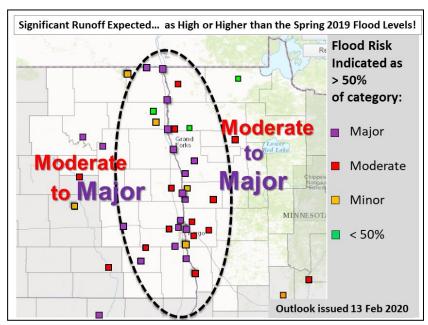

NWS - Weather Forecast Office, Grand Forks ND NWS - North Central River Forecast Center, Chanhassen MN

This outlook is for the U.S. portion of the basin and is based on conditions through Monday, 2/10/2020. All graphics, probabilities, and related discussions are available at **weather.gov/fgf**. The next update will be issued by 2/27/2020.

Bottom Line up Front!

- Good News: Little change since January $23^{\rm rd}$ outlook.
- -- No storms since mid-January: Precipitation has been a bit below normal since January 17-18 storm.
- -- Generally mild conditions: Frost depths are still shallow and quite variable.
- Bad News: Little change since January 23rd outlook.
- -- Very wet soils and high base streamflows persist.
- -- Snowpack/SWE still remains at or above normal leading to high runoff potential.
- Climate outlooks continue to indicate an increased risk for a cooler and wetter late

winter and early spring period which increases the risk for rapid and/or rainfall enhanced runoff.

Long Story Short: The risk for significant snowmelt flooding continues to be substantial, running above long-term historical averages across the Red River and Devils Lake Basins (U.S. portions).

<u>Key Snowmelt Flood Components:</u> (little to no change since January 23rd outlook)

- **1. Base Streamflow: At or near record high levels for this time of year.** USGS analyses indicate that the Red River and most of its ND and MN tributaries (south of Grafton-Argyle) are moderate-thin ice covered and/or flowing at 95th percentiles or greater [link: https://waterdata.usgs.gov/nwis/rt]. Tributaries north of Grafton-Argyle are at 76% to 95%.
- **2. Soil Moisture at Freeze-up: Much above normal throughout. Standing water frozen into some ditches.** [Link: https://www.cpc.ncep.noaa.gov/products/Soilmst Monitoring/US/Soilmst/Soilmst.shtml]
- **3. Frost Depth: Shallower than normal.** Heavy snowcover most of the season has kept frost depths somewhat shallow across the far southern RRV at 6-12 inches. Frost at most locations north of Fargo is 10 to 30 inches deep. Lake/river ice thicknesses are less than normal and quite variable. [Link: https://www.weather.gov/ncrfc/LMI_FrostDepthMap]
- **4. Winter Snowpack/SWE: Above normal.** Since December 1st, snowfall has been running 150-300 percent of normal with SWE ranging from 2.5 to 5.0 inches least across far northeast ND and far northwest MN. [Link: https://www.nohrsc.noaa.gov/nsa/]
- 5. **Precipitation: Sep 1**st **to Feb 9th sets record high.** Total precipitation (rain and snow-water) measured across the basin from Sep 1st through Feb 9th was 4-8 inches above the long-term normal for most of Red River Basin. Notes:

(no significant changes since January 23rd outlook)

1. Devils Lake Basin runoff risk is quite high. A rise of 2 to 3 ft is expected (75% to 25% risk range). A 0.5 to 1 ft rise on Devils Lake is considered about normal.

Note: Devils Lake is currently about a foot higher than this time last year.

- 2. Red River Basin runoff risk is overall quite high. All Red River mainstem points will see significantly high flows.
- heavily influenced by excess flow and soil moisture now.
- coupled with high winter snowpack and SWE.
- exacerbated by a potentially delayed thaw cycle.
- 3. Above normal snowpack and runoff potential is evident in most all MN tributaries.

The northern-most MN tribs have the wettest soils but a somewhat lesser snowpack.

4. ND Wild Rice, Sheyenne, and Maple Rivers are at a much higher runoff risk.

Mid and Upper Sheyenne is carrying substantial soil moisture and snowpack with potential for both early and later crest issues.

Lower Sheyenne through eastcentral ND tribs are also at an exceptionally elevated risk.

Northeast ND threat is mixed, with lesser runoff at the upper basins of the Pembina, Forest, and Park Rivers.

Note: Reduced risk expected for areas protected by new Grafton Bypass!
